[0331]   In some embodiments the apparatus comprises a communication device comprising:

[0332]   a user interface circuitry and user interface software configured to facilitate a user to control at least one function of the communication device through use of a display and further configured to respond to user inputs; and

[0333]   a display circuitry configured to display at least a portion of a user interface of the communication device, the display and display circuitry configured to facilitate the user to control at least one function of the communication device.

[0334]   In some embodiments of the apparatus the communication device comprises a mobile phone.

[0335]   According to a seventh example, there is provided a computer program product including one or more sequences of one or more instructions which, when executed by one or more processors, cause an apparatus to perform at least the following:

[0336]   obtain a media presentation comprising at least one segment;

[0337]   obtain a meta information element attached with the media presentation, the meta information element comprising information on how to access content of the at least one segment;

[0338]   examine a reference included in the meta information element to a meta data provided for the at least one segment, the meta data comprising information on how to access the content of the segment.

[0339]   In some embodiments of the computer program the information on how to access the content of the segment comprises information enabling at least one of the following:

[0340]   multiple presentation options for the content;

[0341]   interaction with the content.

[0342]   In some embodiments of the computer program the interaction enables fetching content from a server dynamically during presenting the media presentation.

[0343]   In some embodiments the computer program comprises one or more sequences of one or more instructions which, when executed by one or more processors, cause the apparatus to obtain from the description of the content a connector indicative of how to obtain the content.

[0344]   In some embodiments of the computer program the connector comprises an indication of a storage location of the content.

[0345]   In some embodiments of the computer program the reference to the description of the content is provided as an access object, wherein the computer program comprises one or more sequences of one or more instructions which, when executed by one or more processors, cause the apparatus to execute the access object to obtain the content when the segment is played back.

[0346]   In some embodiments the computer program comprises one or more sequences of one or more instructions which, when executed by one or more processors, cause the apparatus to:

[0347]   determine whether multiple presentation options for the content are available; and

[0348]   if so, to select one of the available presentation options for the content for playback.

[0349]   In some embodiments of the computer program the media presentation comprises a first video clip captured from a first viewpoint and a second video clip captured from another viewpoint.

[0350]   In some embodiments of the computer program the media presentation comprises at least one of the following:

[0351]   an audio clip;

[0352]   a video clip;

[0353]   a still image.

[0354]   In some embodiments the computer program is comprised in a computer readable memory.

[0355]   In some embodiments the computer readable memory comprises a non-transient computer readable storage medium.

[0356]   According to an eighth example, there is provided an apparatus comprising:

[0357]   means for obtaining a media presentation comprising at least one segment;

[0358]   means for obtaining a meta information element attached with the media presentation,

[0359]   the meta information element comprising information on how to access content of the at least one segment;

[0360]   means for examining a reference included in the meta information element to a meta data provided for the at least one segment, the meta data comprising information on how to access the content of the segment.

[0361]   In some embodiments of the apparatus the information on how to access the content of the segment comprises information enabling at least one of the following:

[0362]   multiple presentation options for the content;

[0363]   interaction with the content.

[0364]   In some embodiments of the apparatus the interaction enables fetching content from a server dynamically during presenting the media presentation.

[0365]   In some embodiments the apparatus further comprises means for obtaining from the description of the content a connector indicative of how to obtain the content.

[0366]   In some embodiments of the apparatus the connector comprises an indication of a storage location of the content.

[0367]   In some embodiments of the apparatus the reference to the description of the content is provided as an access object, wherein the apparatus further comprises means for executing the access object to obtain the content when the segment is played back.

[0368]   In some embodiments the apparatus further comprises:

[0369]   means for determining whether multiple presentation options for the content are available; and

[0370]   means for selecting one of the available presentation options for the content for playback, if the another content for the media clip exists.

[0371]   In some embodiments of the apparatus the media presentation comprises a first video clip captured from a first viewpoint and a second video clip captured from another viewpoint.

[0372]   In some embodiments of the apparatus the media presentation comprises at least one of the following:

[0373]   an audio clip;

[0374]   a video clip;

[0375]   a still image.

1-89. (canceled)

90. An apparatus comprising at least one processor and at least one memory including computer program code, the at least one memory and the computer program code configured to, with the at least one processor, cause the apparatus to perform at least the following:
